2. Citations and explanations

Reference is made to the following document:

. EP-A-0 387 828 (DRORI MORDEK)
19 September 1990 (1990-09-19).

- 1.1 The application relates to a backflush filter system.
- 1.2 The subject matter of claim 1 differs from the closest prior art, document D3, in that the separating device, which is connected downstream of the backflush filter, consists of:
  - a housing;
  - a perforated drum;
  - a steel pipe extending tangentially relative to its outlet on the inner side of the perforated wall of the perforated drum;
  - an outlet on the base of the perforated drum, with a device for removing the sediment;

and in that said separating device is connected upstream of the bag filter.

1 . . .

### INTERNATIONAL PRELIMINARY EXAMINATION REPORT

The separating device according to D3 is connected downstream of the backflush system and consists only of a bag filter.

The problem addressed by the present invention can thus be regarded as that of increasing the rate at which the impurities in the backflush flow are concentrated and achieving an overall improvement in the potential rate of separation.

The solution to this problem, as proposed in claim 1 of the present application, involves an inventive step (PCT Article 33(3)), the reasons being as follows:

Document D3 contains nothing that might suggest the solution to said problem by means of the various features, and the solution according to claim 1 cannot be considered obvious.

The subject matter of claim 1 is therefore novel and involves an inventive step (PCT Article 33(3)).

1.3 Since independent claim 1 is novel and non-obvious, dependent claims 2 to 8 are also novel and inventive.
